ShiftWell

Your Sleep Profile

Make sense of your results, then follow a simple 7-day starter plan.

You took the ShiftWell sleep assessment. This guide helps you read your results and gives you one steady week to start with. Open your results page from the quiz and fill in the two boxes below.

My Sleep Health Score: _____ / 100 **My pattern:** _____

How to read your score

Under 35 Your sleep habits look fairly steady.	**35 to 65** Some habits are working against your sleep.	**Over 65** Several things are adding up, so a steady plan matters.

Lower is better. The score is a guide to your habits and symptoms, not a medical measure.

The 7 sleep patterns

Pattern	What it feels like	Start here
A. The Racing Mind	Tired, but your mind won't switch off when you get into bed.	No screens or work for 45 minutes before bed. Write tomorrow's worries on paper.
B. The 3AM Wake-Up	You wake in the early hours and the waking sticks.	Last caffeine before 12pm, last meal 3 hours before bed. Don't check the time if you wake.
C. Tired But Wired	Exhausted, yet your body stays on alert.	Cap caffeine at 2 drinks before noon. Add morning daylight and 5 minutes of slow movement at 8pm.
D. Sleep Anxiety	You dread bedtime and try hard to make sleep happen.	Turn clocks away. If awake after 20 minutes, get up and read somewhere dim. Tell yourself: I'm resting.
E. Clock Disruption	Your schedule or shift work fights your body clock.	Protect one anchor sleep window. Get bright light after waking, and wear sunglasses home after nights.
F. Disrupted Environment	A partner, pet, noise or light keeps breaking your sleep.	Check light, sound and temperature. Fix the cheapest one first.
G. Rebound Insomnia	Your sleep was fine until stress, travel or illness changed it.	Set a fixed wake time for 14 days and get outside within an hour of waking.

Your 7-day starter plan

Start with the step for your pattern from page 1, then follow the days below in order. Small, steady changes work better than doing everything at once.

Day 1	**Set your anchor** Choose one wake-up time and keep it every day, weekends too. Tonight, just note when you had your last coffee, meal and drink. Change nothing yet.
Day 2	**Morning light** Get outside, or sit by a bright window, within an hour of waking for about 10 minutes. Move your last caffeine to before noon.
Day 3	**Screen curfew** No screens or work for 45 minutes before bed. Write tomorrow's worries on paper instead of carrying them into bed.
Day 4	**Evening basics** Finish your last meal about 3 hours before bed. Keep alcohol out of your evening, since it breaks up the second half of the night.
Day 5	**Bedroom check** Look at three things only: light, sound and temperature. Fix the cheapest one first, such as blackout cover or earplugs.
Day 6	**Calm the night** In bed, breathe in for 4, hold for 7, out slowly for 8. Turn clocks away. If you are still awake after about 20 minutes, get up and read somewhere dim until sleepy.
Day 7	**Review and keep going** What helped most? Keep it. Hold your wake-up time for the next 14 days. A steady wake time is what keeps your body clock settled.

Work nights? Do Day 2 after you wake, whatever time that is, and wear sunglasses on the commute home after a night shift.

When to talk to a doctor
Speak with a licensed healthcare provider if you have loud snoring or gasping at night, if sleep problems have lasted more than a year, or if poor sleep is affecting your safety or daily life. This guide is educational and does not replace medical assessment.

Want the full system?

Understanding Your Body Clock includes your full sleep profile breakdown, a 14-day reset calendar, a sleep diary, a 3AM emergency card and wind-down audio.
